

## USE OF EXOSOMES

DERIVED FROM MESENCHYMAL  
STROMAL CELLS IN THE TREATMENT OF

# ALOPECIA

Alopecia is a condition of hair loss, in which the hair follicle is affected.

The causes of this condition are diverse and include genetic factors, endocrine disorders, stress, gender and age.

Mesenchymal Stromal Cells (MSC) have high potential as a treatment for hair loss in general.

These cells have the ability to release multiple bioactive compounds with regenerative and restorative actions on the hair follicles.

VEGF, HGF, and PDGF have been scientifically proven to achieve hair regeneration.

If you suffer from alopecia or hair loss  
at Red Exocel we can help you.
